

Portfolio Website: Antigravity → GitHub → Vercel

Follow **every step in order**. Do not skip any step.

Your final website will follow this path:

Antigravity → Desktop Folder → GitHub → Vercel → Live Website

STEP 1 - Open Antigravity

1. Open **Antigravity** on your computer.
2. Log in using your account.
3. Once you are inside Antigravity, create/open a project folder.

STEP 2 - Create a Folder on Your Desktop

Before creating your website, make a folder on your **Desktop**.

For example:

Desktop

↓

My Portfolio

Your folder name can be:

my-portfolio or firstname-portfolio

Important: Do **NOT** create unnecessary folders inside this folder.

STEP 3 - Create Your Portfolio Using Antigravity

Open your **Desktop** → **my-portfolio** folder in Antigravity.

Then ask Antigravity to create your portfolio.

You can give it a prompt like: (with your all basic details)

“Create a responsive personal portfolio website using HTML, CSS and JavaScript.

Keep all website files inside this project folder.

Create:

- index.html
- style.css
- script.js

Make sure index.html correctly links to style.css and script.js using relative file paths.

Do not put the main website files inside another unnecessary folder.

Make sure the website works properly when opened from the local folder.”

STEP 4 - Check Your Files Before Going to GitHub

Open your **portfolio folder** on the Desktop.

You may see many files like *.html*, *.css*, *.js*, *.json*, images, and other files.

That's okay. Don't delete anything.

Just make sure all the website files are inside **one main portfolio folder**.

STEP 5 - Test Your Website

Before uploading anything to GitHub:

1. Open your portfolio folder.
2. Double-click: ***index.html*** or your ***.html*** file.
3. Your website should open in the browser.
4. Check:
 - Design is visible
 - Images are visible
 - Buttons work
 - Animations work
 - Navigation works
 - CSS is loading (website design and colours are showing properly)
 - JavaScript is working (buttons and other actions are working properly.)

If the website looks like plain HTML with no design, **stop and fix it before uploading to GitHub.**

STEP 6 - Create Your GitHub Account

Go to: **GitHub** : <https://github.com/>

1. Click **Sign up**.
2. Enter your email.
3. Create a password.
4. Choose your GitHub username.
(Use a simple and professional name, preferably your name. Avoid usernames like ***devilkiller123***, ***coolboy999***, etc.)
5. Complete the verification.
6. Verify your email if GitHub asks you to.

GitHub requires an account before you can create a repository.

STEP 7 - Create Your GitHub Repository

1. Log in to your **GitHub account**.
2. Click the + button at the top-right corner.
3. Click **New repository**.
4. In **Repository name**, enter a simple name for your portfolio.

For example: ***john_portfolio*** or ***nia_portfolio***

5. Select **Public**.
6. Click **Create repository**.

Your repository is now ready.

STEP 8 - Upload Your Portfolio Files

Now you will upload your portfolio files to GitHub.

1. Open the repository you just created.
2. Click **Add file**.
3. Click **Upload files**.
4. Select the files from your portfolio folder.
5. Upload all the required website files.
6. Scroll down and click **Commit changes**.

Important: Upload the files from inside your portfolio folder.

Your GitHub repository should look something like:

index.html
style.css
script.js
images
other files

You may have more files. **Do not delete any files created by Antigravity.**

STEP 9 - Check Your GitHub Files

After uploading, check your repository.

Make sure you can see:

index.html directly on the main GitHub page.

You should **not** have to open another folder to find *index.html*. If *index.html* is directly visible, your files are in the correct place.

STEP 10 - Create Your Vercel Account

Now you will make your website live using Vercel.

Go to: **Vercel:** <https://vercel.com/>

1. Click **Sign Up** or **Log In**.
2. Choose **Continue with GitHub**.
3. Log in using the GitHub account you created.
4. Allow Vercel to connect with your GitHub account if asked.

STEP 11 - Import Your GitHub Project

After logging into Vercel:

1. Go to your Vercel dashboard.
2. Click **Add New**.
3. Select **Project**.
4. Find the GitHub repository you created.
5. Click **Import**.

You are now connecting your GitHub portfolio to Vercel.

STEP 12 - Give Your Vercel Project a Name

Vercel will ask you for a **Project Name**. Use a simple and professional name.

For example: *john-portfolio* or *nia-portfolio*

Remember:

- Use lowercase letters.
- Do not use spaces.
- Keep the name simple.
- Use your name + portfolio if possible.

STEP 13 - Check the Vercel Settings

For a basic HTML, CSS and JavaScript website, you normally do not need to change anything. Keep the settings as they are. Then continue to deployment.

STEP 14 - Deploy Your Website

Click the **Deploy** button. Wait for Vercel to finish deploying your website.

When the deployment is complete, Vercel will show that your website has been successfully deployed.

STEP 15 - Open Your Live Website

Vercel will give you a website link.

It will look similar to: <https://john-portfolio.vercel.app/>

Click the link and open your website.

STEP 16 - Check Your Live Website

Open your Vercel website and check everything again.

Make sure:

- Website design and colours are showing properly.
- Images are showing.
- Buttons and other actions are working properly.
- All sections are visible.
- Website looks good on your phone as well.
